4093. Maximize Sum After At Most K Digit Rearrangements

Solved

Medium

You are given an integer array `nums` of length `n` and an integer `k`.

In one operation, you may choose any element of `nums` and **rearrange** its decimal digits in any order to form a new integer.

Return the **maximum** possible sum of the array after performing **at most** `k` operations.

Example 1:

> **Input:** nums = [123,45], k = 1
>
> **Output:** 366
>
> **Explanation:**
>
> - We choose `nums[0] = 123` and rearrange its digits to form 321.
> - The array becomes `[321, 45]`. Thus, the total sum is `321 + 45 = 366`.

Example 2:

> **Input:** nums = [102,90,14], k = 2
>
> **Output:** 341
>
> **Explanation:**
>
> - We choose `nums[0] = 102` and rearrange its digits to form 210.
> - We choose `nums[2] = 14` and rearrange its digits to form 41.
> - The array becomes `[210, 90, 41]`. Thus, the total sum is `210 + 90 + 41 = 341`.

Constraints:

- `1 <= n == nums.length <= 10^5`
- `1 <= nums[i] <= 10^9`
- `1 <= k <= n`
